The Frontier system will be composed of more than 100 Cray Shasta cabinets with high density compute blades powered by HPC and AI-optimized AMD EPYC™ processors and Radeon Instinct™ GPU accelerators purpose-built for the needs of exascale computing. The new accelerator-centric compute blades will support a 4:1 GPU to CPU ratio with high speed AMD Infinity Fabric™ links and coherent memory between them within the node. Each node will have one Slingshot interconnect network port for every GPU with streamlined communication between the GPUs and network to enable optimal performance for high-performance computing and AI workloads at exascale.

To make this performance seamless to consume by developers, ORNL and Cray will partner with AMD to co-design and develop enhanced GPU programming tools designed for performance, productivity and portability, which will tightly integrate with the existing AMD ROCm open compute platform. In addition, Frontier will support many of the same compilers, programming models, and tools that have been available to OLCF users on both the Titan and Summit supercomputers. In fact, Summit is a premier development platform for Frontier.

**Hardware**

| Node             | 1 HPC and AI Optimized AMD EPYC CPU  
4 Purpose Built AMD Radeon Instinct GPU |
| CPU-GPU Interconnect | AMD Infinity Fabric  
Coherent memory across the node |
| System Interconnect | Multiple Slingshot NICs providing 100 GB/s network bandwidth  
Slingshot dragonfly network which provides adaptive routing, congestion management and quality of service. |
| Storage          | 2-4x performance and capacity of Summit’s I/O subsystem. Frontier will have near node storage like Summit. |

**Programming Environment**

Frontier will support multiple compilers, programming models, and tools, many of which are readily available on Summit today. Below are the compilers, programming languages and models, and additional tools that we are targeting to make available on Frontier. As with any large, complex deployment, the list could change as the project progresses and we get closer to production.

| Compilers | Cray PE  
AMD ROCm  
GCC |

May 7, 2019
| Programming Languages and Models Supported | C, C++, Fortran (for all compilers)  
|                                           | OpenMP 5.x (Cray, AMD, and possibly GCC compilers)  
|                                           | Cray MPI  
|                                           | UPC (Cray and GCC compilers)  
|                                           | Coarray Fortran, Coarray C++ (Cray compilers)  
|                                           | AMD HIP  
|                                           | Chapel  
|                                           | Global Arrays  
|                                           | Charm++  
|                                           | GASNet  
|                                           | OpenSHMEM |
| System-level Programming Tools            | CrayPat/Apprentice2  
|                                           | Cray Reveal

|                                           | Score-P  
|                                           | VAMPIR |
| Node-level Programming Tools              | GNU gprof  
|                                           | PAPI  
|                                           | AMD ROCProfiler |
| Debugging and Correctness Tools           | ARM DDT  
|                                           | Cray CCDB  
|                                           | Stack Trace Analysis Tool  
|                                           | Cray GDB4HPC  
|                                           | gdb  
|                                           | AMD ROCm debug service and GDB-MMI  
|                                           | Cray Abnormal Termination Processing |
| Math Libraries                            | BLAS  
|                                           | LAPACK  
|                                           | ScaLAPACK  
|                                           | Iterative Refinement Toolkit  
|                                           | FFTW or similiar  
|                                           | PETSc  
|                                           | Trilinos |
| GUI and Visualization APIs, I/O Libraries | X11  
|                                           | Motif  
|                                           | Qt  
|                                           | NX, NeatX, or similiar  
|                                           | NetCDF  
|                                           | HDF5 |

May 7, 2019
HIP
The OLCF plans to make HIP available on Summit so that users can begin using it prior to its availability on Frontier. HIP is a C++ runtime API that allows developers to write portable code to run on AMD and NVIDIA GPUs. It is essentially a wrapper that uses the underlying CUDA or ROCm platform that is installed on a system. The API is very similar to CUDA so transitioning existing codes from CUDA to HIP should be fairly straightforward in most cases. In addition, HIP provides porting tools which can be used to help port CUDA codes to the HIP layer, with no loss of performance as compared to the original CUDA application. HIP is not intended to be a drop-in replacement for CUDA, and developers should expect to do some manual coding and performance tuning work to complete the port.

Some key features include:

- HIP is very thin and has little or no performance impact over coding directly in CUDA or hcc “HC” mode.
- HIP allows coding in a single-source C++ programming language including features such as templates, C++11 lambdas, classes, namespaces, and more.
- The “hipify” tool automatically converts source from CUDA to HIP.
- Developers can specialize for the platform (CUDA or hcc) to tune for performance or handle tricky cases.

Migration Path from Summit to Frontier

**Machine Learning**

Like Summit, Frontier will be fine tuned to run AI workloads. The vendor will provide a fully optimized, scalable data science suite. This area is rapidly evolving, so modifications to precise tools/libraries are very likely. The plan is to make widely used frameworks (such as the ones below) available in addition to the Cray Programming Environment Deep-learning plugin. This plugin improves algorithms and performance for training of deep neural networks and provides support for Apache Spark, GraphX, MLib, Alchemist frameworks, and pbdR.

| Frameworks                  | TensorFlow  
|                            | BigDL for Apache Spark  
|                            | PyTorch  
|                            | MXNet  
|                            | Keras  
|                            | MLib  
|                            | scikit-learn  
|                            | OpenCV  
| Additional Tools           | Cray Programming Environment Deep-learning Plugin  
|                            | TensorBoard (notebook-based NN hyper-parameter turning framework)
